YouGov interviewed 3861 respondents. The respondents were
matched to a sampling frame on gender, age, race, and education. The
frame was constructed by stratified sampling from the full 2017 American
Community Survey (ACS) 1—year sample with selection within strata by weighted
sampling with replacements (using the person weights on the public use
file).

The matched cases were weighted to the sampling frame using propensity
scores. The frame were combined and a logistic regression was estimated
for inclusion in the frame. The propensity score function included
age, gender, race/ethnicity, years of education, and region. The propensity
scores were grouped into deciles of the estimated propensity score in the
frame and post—stratified according to these deciles.

The weights were then post—stratified on 2016 Presidential vote choice, and
a four—way stratification of gender, age (4—categories), race (4—
categories), and education (4—categories), to produce the final weight.
